DETAILED ACTION

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

2. Claims 1-11 are rejected under 35 U.S.C. 102(e) as being anticipated by Beeler (U.S. Patent No. 6,771,956).

Regarding claims 1-11, Beeler teaches a system and method to monitor call data for a number of cellular phones simultaneously and in real time. A UNIX-based diagnosis software allows flexibility and versatility in call monitoring and functionality testing of a cellular switch. The diagnosis software scans and parses, in real time, the call data received from a cellular switch so as to enable a technician to monitor the radio environment of a cell when a call is placed from that cell. Additional cellular switch-specific data such as radio channels assigned to a cell phone call, handoff signals communicated, power level for a radio link, etc., may also be monitored on a per-call basis. Thus, simultaneous and real time testing of more than one radio link can be performed by a technician in a cellular service provider's network during, for example, routine maintenance of a cellular switch, installation and testing of a new switch,

addition or reconfiguration of a cell site, etc. (see column 7, lines 33-52 and Summary of the Invention) It should be noticed that call data information for the monitored MINs can be displayed on the testing unit display screens (column 6, lines 31-55) and the communication network 24 facilitates data communication between the UNIX system 26 and the remote testing unit 22, and includes a combination of wireline and wireless networks such as, for example, a WAN (wide area network), a MAN (metropolitan area network), the Internet, a wireless local loop, a Bluetooth-based wireless LAN (local area network), etc. The remote testing unit 22 may be a general-purpose PC (personal computer), a computer workstation, or a dedicated portable testing unit that is capable of data communication over the communication network 24 (column 5, lines 9-28).
